

1. Calculate $\langle 1, -4 \rangle + (1, 3)$.

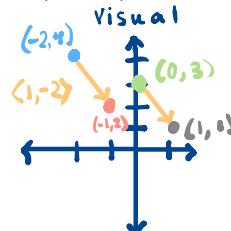

$$\begin{aligned}\langle 1, -4 \rangle + (1, 3) &= (1+1, -4+3) \\ &= (2, -1).\end{aligned}$$

visual

2. The vector V moves the point $(-2, 4)$ to $(-1, 2)$. Calculate $V + (0, 3)$.

$$\begin{aligned}V &= (-1, 2) - (-2, 4) \\ &= (-1 - (-2), 2 - 4) \\ &= \langle 1, -2 \rangle \\ \text{so, } V + (0, 3) &= \langle 1, -2 \rangle + (0, 3) \\ &= (1, 1).\end{aligned}$$

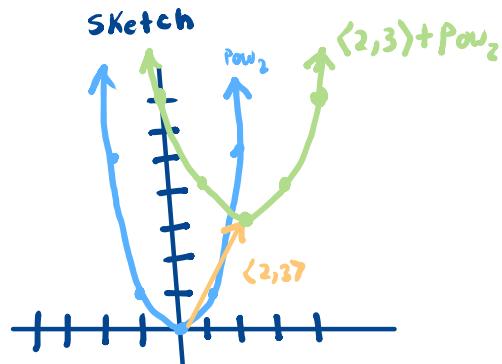

3. Sketch $\langle 2, 3 \rangle + \text{pow}_2$ and find an equation that describes the points in this new function.

$$\begin{aligned}g &= \langle 2, 3 \rangle + \text{pow}_2 \\ &= \langle 2, 3 \rangle + \{(x, x^2) : x \in \mathbb{R}\} \\ &= \{(x+2, x^2+3) : x \in \mathbb{R}\} \quad \text{Set } X = x+2 \\ &= \{(X, (X-2)^2+3) : x-2 \in \mathbb{R}\} \quad \text{so } X-2=x\end{aligned}$$

So equation is

$$g(x) = (x-2)^2 + 3.$$

4. Sketch $\langle -2, -3 \rangle + \text{pow}_2$ and find an equation that describes the points in this new function.

$$\begin{aligned}g &= \langle -2, -3 \rangle + \text{pow}_2 \\ &= \langle -2, -3 \rangle + \{(x, x^2) : x \in \mathbb{R}\} \\ &= \{(x-2, x^2-3) : x \in \mathbb{R}\} \quad \text{Set } X = x-2 \\ &= \{(X, (X+2)^2-3) : x+2 \in \mathbb{R}\} \quad \text{so } X+2=x\end{aligned}$$

So equation

$$g(x) = (x+2)^2 - 3.$$
